Comment on acp-2020-1286
Anonymous Referee #2

The manuscript provides thorough analysis of the influence of typhoons on the occurrence of ozone episodes in the Pearl River Delta, China.

Despite many papers (correctly referenced by the Authors) have been published concerning ozone pollution in the area, the manuscript resumes the different aspect of ozone episodes development and can be a guide through previous literature. The modelling section is, from my point of view, the most important to provide a clear support to the hypothesis and correlations provided by the previous analysis. A possible missing point is the evaluation of the overall import/export of ozone, to estimate if the PRD region is responsible of a net export of ozone increasing the amount of pollutant over the region.

The overall result that typhoon influenced O3 episodes have a major contribution from long range transport (from outside the model domain) and advection from nearby China regions has relevant policy implications that are only quickly commented in the conclusions and would merit a wider discussion. Local O3 precursor emission control can be expected to have a limited effectiveness and regional policies seem definitely needed, at China national level but even at South and East Asia regional level, to be able to reduce population exposure and overall ozone production.

The manuscript is well written and needs few clarifications/integrations to reach publication quality.

**Detailed comments**

**Introduction**

Lines 40-42

This is due to the O3 persistence in the atmosphere due to its relatively long lifetime in the atmosphere. The Authors should consider mentioning it.

Line 49

“of” just before the symbol “>” should be removed.

**2 Methods**
Why precipitation is not considered?

Does the mentioned “30%” refers to the total number of days or to the number of polluted days?

This consideration seems convincing for July only. For October the difference of values with/without typhoons seems rather small.

This is not clear, what is the reason to discard 5 episodes?

Why the endpoint of the back trajectories has been set to 500m and not nearer the surface?

What is the horizontal space resolution of the mentioned matrix?

Setting the trajectory starting points to 100m seems reasonable for industrial emissions, but it seems high for road transport related emissions or other surface sources.

Were time durations attributed to points and then gridded? on which target grid?

The sentence “model, the CMAQ model (version 5.0.2)” should be simplified to avoid useless word repetition.

The meaning of the sentence “all O3 pollution days in these two months served as representative O3 pollution days under multiple scenarios.” is not clear.

The meaning of this sentence is not clear.

“CMAQ model”, or “model application” would read better that “CMAQ modelling”.
Alternatively to zero emission a fractional reduction could be applied to reduce non linearity. See e.g. https://fairmode.jrc.ec.europa.eu/activity/ct1

The Authors should comment this alternative approach and the reasons supporting their choice.

3 Comparison of meteorological conditions

Lines 227-231

It is not clear how ERA-Interim fields have been processed. Has a gridded area been processed or timeseries have been extracted in few points? What choice has been done and why?

Lines 228-229

The reference to first and second categories in Sect 2.1 is not clear.

Lines 269-271

This sentence is not clear. Does it mean that during the summer the air masses advected by slow wind are expected to bring higher O3 concentration? Or with low wind speed local phenomena would prevail on advection?

Lines 279-280

The reference to Sect 2.1 is not clear.

Lines 280-281

Are values in Figure 4 mean values over the considered time period?

Line 282

Downdrafts seem to be at higher levels from the Figure. Please refer to the Figure vertical scale in hPa to be better understood by the reader.

Line 314

How values in Figure 6 have been computed from ERA-Interim fields? Are they mean values?

Line 343-344

The meaning of the sentence is obscure, what does “and offset the influence of weakened O3 formation to some extent.” mean?

Lines 344-346

Please relate to the unfavourable/favourable conditions for ozone formation shown in the previous sections.

4 Comparisons of O3 processes and sources
I can't find this number in Figure 10.

This discussion about anthropogenic emissions control is relevant and should be expanded to provide useful input to air quality management and suggestions to conceive measures capable to reduce the population exposure and the production of ozone at global scale.
