Author comment on "Reassessment of the radiocesium resuspension flux from contaminated ground surfaces in eastern Japan" by Mizuo Kajino et al., Atmos. Chem. Phys. Discuss., <https://doi.org/10.5194/acp-2021-687-AC1>, 2021

Dear Anonymous Referee #1,

Thank you very much for your comment. The height of high volume samplers at Namie (Tsushima) and Tsukuba sites was 1.2 m from ground surface and that at Fukushima site was at 25 m. In the revised manuscript, we will include these information and discussion on the vertical differences based on your review comments, which will be posted later. I am sorry for my late response and we look forward to your review comments.

Thank you for your time, in advance.

With best regards,

Mizuo Kajino
