Referee comment on "O₃-precursor relationship over multiple patterns of timescale: a case study in Zibo, Shandong Province, China" by Zhensen Zheng et al., Atmos. Chem. Phys. Discuss., <https://doi.org/10.5194/acp-2022-592-RC1>, 2022

Comments on "O₃-precursor relationship over multiple patterns of time scale: A case study in Zibo, Shandong Province, China"

General comments:

Based on 5-month observation data of VOCs, CO, NO_x and meteorological factors at three sites in a major prefecture-level city of Zibo, Shandong province of China, this manuscript explored the relationship between O₃ and its two precursors (VOCs and NO_x) by using a 0-D box model. The results implied that diagnosis of photochemical O₃ formation regimes was better based on model simulations with constrain of the observation data on shorter time scales (e.g., daily or weekly scales), which would have a certain significance for developing O₃ control strategies in different pollution areas. To my knowledge, there are few studies to comparably investigate the difference of photochemical O₃ formation regimes diagnosed by model simulations with input of observation data treated on different time scales. Therefore, this reviewer recommends the manuscript to be published in the journal after considering the following specifics.

Specifics:

There are many grammar mistakes, repetitive specifications and unclear descriptions thorough the whole manuscript, and thus an English native speaker is suggested to polish

the manuscript.

The results and discussion seemed to be very confused for discussing the results at the three sites on the four-time scales. As the topic of this manuscript is "O₃-precursor relationship over multiple patterns of time scale", the investigation is better focused on the observation data at one sampling site, rather than at the three sampling sites.

Abstract:

Line 24-27, the subject of "reactivity" doesn't match the predicate of "were" in this sentence; "time scale" is better replaced by "time scales"; "varied from wider and narrower" is better moved before the parentheses. This sentence seemed to be vague, and thus is better to be rephrased.

Lines 28-30, "The time series of the photochemical regime" seemed not match "magnitude".

Introduction:

Lines 52-54, "the non-linearity of ozone pollution and complex process involved in it" should be "the complex non-linear relationship between O₃ formation and its precursors (VOCs and NO_x)"; "challenges" doesn't match "lies".

Lines 61-65, the large spatiotemporal variability of O₃-precursor relationship has been widely reported in literature, rather than a finding of your recent study. Therefore, this sentence is better to be rephrased.

Methods:

Lines 107-112; 119-127; 128-137, why did you describe the VOCs measurements in three paragraphs? The time resolution of VOCs measurements was repeated for three times. The description of "a FID detector is applied for quantification" is not correct. The FID detector can only detect the signal of target species, rather than quantification of the targets. Why did you respectively select Tenax GR to pre-concentrate C₆-C₁₂ VOCs and C₂-C₆ VOCs for the GC-FID and the GC/FID/PID? Could the Tenax GR effectively capture C₂-C₆ VOCs at room temperature? What's the role of PID for the GC/FID/PID? How about variations of the retention times of VOCs during the monthly calibration period?

Lines 138-145, besides the calibration, field comparison for the VOCs measurements by using the two types of GCs at one of the tree sites is most important for the QA/QC. Did you conduct the comparison?

Lines 163-165, "for the best reproduction of O₃" at the end of this sentence.

Lines 177-179, the subject of "dataset" doesn't match the predicate of "were"; Considering the repetition for classifying the four patterns of time scale, this sentence is suggested to "Specifically, the entire campaign data classified as four patterns of time scale were modeled as base runs."

Lines 211-216, to avoid confusing between the species of X and its concentration, PO_x(X) and PO_x(X-DX) are suggested to be PO_x(C_X) and PO_x(C_X-DC_X); either "(ΔX, 10% of X in this study in accordance with the previous studies" or "Therefore, ΔC(X)/C(X) was 10% in this study" can be deleted to avoid repetition.

Results and discussion:

Line 245, "within" should be "among".

Lines 247-250, the bracket is suggested to be moved after alkene*.

Lines 254-257, why were the nocturnal O₃ concentrations significantly underestimated by the model simulations (e.g., Fig. S3)?

Lines 280-287, why was the model performance for TZ better than for XD and BJ?

Line 292, alkenes* have been noted before, and thus the brackets in here can be deleted.

Lines 309-313, the relationship between the monthly variations of the species and the RIR is better to be discussed, or readers cannot understand why you present them in here?

Lines 314-316, "two regimes (i.e., VOC-limited and NO_x-limited) or" can be deleted because the three regimes are prevailingly adopted.

Lines 326-328, the correlation between the monthly TVOC/NO_x and RIRNO_x/RIRAVOC would become worse when only one sampling site was considered. Therefore, Fig. 5b could not well explain the considerable variation of monthly O₃ formation chemistry.

Lines 344-347, the correlation between the weekly TVOC/NO_x and RIRNO_x/RIRAVOC at one sampling site (Fig. 5c) was also weak for explaining the weakly variation of O₃ formation chemistry. Additionally, the data point with TVOC/NO_x of zero for BJ in Fig. 5d is wrong, should be removed.

Lines 361-363, the description seemed not well reflect the time series of daily RIRNO_x/RIRAVOC in Fig. S11 with irregular variations.

Lines 399-402, the model simulations with inputting the average values for the five-month scale would greatly mask the large temporal variations of species especially for meteorological factors (such as sunlight and temperature), which is the key reason for the discrepancy of RIR values between five-month scale and daily scale. It is not proper to explain the discrepancy of RIR by the uncertainty.

Lines 415-418, there is a repeated comparison.

Line 460, besides the analyzed uncertainties, the uncertainty due variation of meteorological factors for the long period scales may play a more important role in the O₃ sensitive chemistry.
