We thank again for the interest in our article.

Here are the answers we provide:

1- the experimental part has been modified in order to specify the methodology followed and the operating principle of the sensors used

2- the discussion of the results has been modified to take into account the editor's requests. The cross-sensitivity with NO2 was not investigated in this paper. The article only focuses on the performance of ozone sensors. This sensitivity with NO2 is only mentioned only to give the limits of the use of these ozone sensors in the field under real conditions.

3- Legends below the tables, pictures and figures have been added to make the figures and tables more explicit

4- The conclusion has been modified to more explicitly highlight potential recommendations

5- The use of the English language has been revised to make the different parts of the text clearer

A revised manuscript will be submitted with supplementat material
