Community comment on "Predicting turbidity and Aluminum in drinking water treatment plants using Hybrid Network (GA- ANN) and GEP" by Ruba Alsaed et al., Drink. Water Eng. Sci. Discuss., <https://doi.org/10.5194/dwes-2021-8-CC1>, 2021

The article in general is good written and it is about a very important issue related to drinking water treatment. I noticed that the references are quite new. And the equation gives the article more strength, likewise the GUI .

But I have a question why the researcher used GA and ANN and GEP

not fuzzy for example?

And at the end of the article I think it is good to mention the other 3 equations that resulted from the research, not just the best one

GOOD LUCK
