Comment on egusphere-2022-148
Tim Woollings (Editor)

Editor comment on "Jet stream variability in a polar warming scenario – a laboratory perspective" by Costanza Rodda et al., EGUsphere, https://doi.org/10.5194/egusphere-2022-148-EC1, 2022

I’d like to thank the reviewers for their constructive and helpful reviews, and the authors for their responses to these. I look forward to receiving a revised version of the paper. As mentioned in the response to Reviewer 1’s first comment, the beta-effect may well play a role in a more realistic setting, but the present focus on baroclinic instability still provides useful information. Some additional discussion of this in the revised paper will be useful to provide a broader context for the results.
