Comment on egusphere-2022-311
Matthias Konrad-Schmolke

Community comment on "Epidote dissolution–precipitation during viscous granular flow: a micro-chemical and isotope study" by Veronica Peverelli et al., EGUsphere, https://doi.org/10.5194/egusphere-2022-311-CC1, 2022

2 Geological setting

The geological setting as well as Fig. 1 are rather poor. It might not be necessary for the general understanding of the results and interpretations in this manuscript, but it would be beneficial to the general quality of the work if the geological background would be a bit more detailed. The map is not very helpful once the reader would like to see the Aar massif's position in the Alpine orogen.

Lines 72ff.: "... and mainly records Alpine deformation ...". What else deformation does it record?

Lines 75ff.: What kind of shear zones are they? How wide? What does "a large number" mean? What orientations?

In general, this paragraph needs reworking!
