Referee comment on "Patterns and drivers of water quality changes associated with dams in the Tropical Andes" by R. Scott Winton et al., EGUsphere, https://doi.org/10.5194/egusphere-2022-403-RC1, 2022

The ms is extremely well written and easy to read. The approach is very well thorough and the findings and recommendations clear. There are some minor typological corrections that can be picked up by a copy editor. I would emphasise that is it extremely rate for me to come to such a conclusion on the first draft. Indeed I only remember such a positive reaction to one other ms in the hundreds of reviews that I have done.
