Recommendation on egusphere-2022-474
Aurélien Podglajen (Editor)

Editor comment on "On the impact of Himalaya-induced gravity waves on the polar vortex, Rossby wave activity and ozone" by Ales Kuchar et al., EGUsphere, https://doi.org/10.5194/egusphere-2022-474-EC1, 2022

Dear Authors,

This message is to clarify the next steps of the review process. Both referees have expressed serious reservations about the general conclusions of the manuscript and concerns about the statistical significance of the results presented. In this context, I do not encourage the submission of a revised version unless all comments can be satisfactorily addressed. This requires sizable additional analysis and confirmation and conclusive proof of the statements made.

In case you do not plan to submit a revised manuscript, I still recommend posting an answer and explaining your current understanding of the question.

Sorry for not reaching out sooner. In case any question arises, please do not hesitate to contact me.

With best regards,

Aurélien Podglajen
