Re referee comment on "Adaptively monitoring streamflow using a stereo computer vision system" by Nicholas Reece Hutley et al., EGUsphere, https://doi.org/10.5194/egusphere-2022-735-RC3, 2022

In addition to my official refereed comments, I would express agreement with RC1's general comments. Although I share RC1's frustration with the lack of explicitness and thoroughly detailing the CVSG algorithms. I think that there is a valid criticism here that the paper results would be hard to repeat or evaluate given the details provided.

If the authors can expand on the details such as to address RC1's comments, I believe that many of my original comments will also be addressed.
