Author comment on "Shallow marine carbonates as recorders of orbitally induced past climate changes – example from the Oxfordian of the Swiss Jura Mountains" by André Strasser, EGU Sphere, <https://doi.org/10.5194/egusphere-2022-74-AC2>, 2022

Dear Colleague

Thank you very much for your very thorough and constructive review. I will do my best to consider all of your comments and suggestions. This will mean, however, expanding the manuscript to add more explanations of the critical points you mention and also add some more sections to justify the cyclostratigraphic interpretation. I wrote this manuscript as a review addressed more at palaeoclimatologists than sedimentologists and stratigraphers and didn't want to repeat too much of already published work, but I agree with you that it should be a stand-alone paper and that more argumentation is needed.
