Referee comment on "Aircraft measurements of water vapor heavy isotope ratios in the marine boundary layer and lower troposphere during ORACLES" by Dean Henze et al., Earth Syst. Sci. Data Discuss., <https://doi.org/10.5194/essd-2021-238-RC2>, 2021

---

Dear Dean,

I think I have the updated version of your manuscript with all the links that you mention. Are you talking about those huge zip archives of more than 130Gb?

I admit that I didn't dare to download those during the review process, because they are too big. To reply to your question, I've been trying to download those in the past few days, without success. It's really too big. Is there a link that I could use with wget? That might help a bit.

Beyond this technical issue, is this huge size really justified? Is there a way to provide a lighter, more synthetic, more user-friendly archive?
