It is a thrill to see the work about the database organizing multidimensional information of antiarchs. No doubt that the dataset will empower the research of paleo-biogeography and its application in paleo-map reconstruction. Looking forward to the data-driven research on antiarchs coming to publish in the future.

But I have three questions.

- Figure 2 is very impressive and fresh. This kind of illustrate image was not seen in a paleontological paper before. How did you draw it?
- Do you think the research history influences fossil records? Some blank areas can be seen in Figure 4.
- Where could I get the TrackPoint to calculate the paleo coordinates on my data?
