Thank you Albert for your positive feedback. Data on seasonality was initially sought during the review process, however it become apparent that this was not going to be possible because many articles did not report the date of data collection, therefore we could not be sure of season. Instead we focused on categorical variables that could be included for the majority of numerical variables compiled. For example, the dataset reports the year of data collection which could be useful for deciphering long-term temporal trends in seagrass structure, biomass, net primary production and reproduction variables, even if an effect of season cannot be delinated.
