Community comment on "GAN-argcPredNet v1.0: a generative adversarial model for radar echo extrapolation based on convolutional recurrent units" by Kun Zheng et al., Geosci. Model Dev. Discuss., https://doi.org/10.5194/gmd-2021-165-CC1, 2021

This article mainly introduces a new type of generative adversarial network, which can be used for radar echo extrapolation, and the effect is obvious. I have the following suggestions:
1. The content of the related work part is a bit lacking, and some related research work can be supplemented.
2. The summary of the future outlook is a bit vague and can be written more clearly.
