Author comment on "The linear feedback precipitation model (LFPM 1.0) – a simple and efficient model for orographic precipitation in the context of landform evolution modeling" by Stefan Hergarten and Jörg Robl, Geosci. Model Dev. Discuss., <https://doi.org/10.5194/gmd-2021-179-AC1>, 2021

Dear Astrid Kerkweg,

thanks for reminding us! We have now moved the codes and data to a persistent archive at <https://freidok.uni-freiburg.de/data/219131>, doi 10.6094/UNIFR/219131. Since there are always at least some changes to the figures in the revised version, I usually prefer to have the final version archived instead of the first version, but I do not mind.

We will also think about a name or acronym for the title. Personally, however, I am not convinced that each more or less "new" set of equations deserves an own name or acronym, although I accept that this has become some kind of standard in order to promote work. However, it should not be reduced to the name of the software where it is actually implemented.

Best regards,

Stefan Hergarten
