Community comment on "SnowClim v1.0: High-resolution snow model and data for the western United States" by Abby C. Lute et al., Geosci. Model Dev. Discuss., <https://doi.org/10.5194/gmd-2021-407-CC1>, 2021

This is a great model that produces a high temporal and spatial resolution of SWE dataset over western CONUS. I am not an expert in the physical-based snow models and might miss something, but I wonder besides the calibration period from 2000 to 2013, did the author compare the result from these optimal parameters with the SNOTEL observations after the year 2013? Thanks!
