Review of gmd-2022-56

Anonymous Referee #3

Referee comment on "The Earth system model CLIMBER-X v1.0 – Part 1: Climate model description and validation" by Matteo Willeit et al., Geosci. Model Dev. Discuss., <https://doi.org/10.5194/gmd-2022-56-RC3>, 2022

This paper serves as an introduction to the CLIMBER-X Earth system model. I found it to be extremely well written, and therefore pleasant to read. It describes in detail all of the key components of the model and how they interact, and then follows this with an evaluation of the model performance over the period 1850-present, which most readers will easily be able to relate to due to the authors' efforts to compare their simulation with both observations and the CMIP simulations and assessments.

CLIMBER-X itself performs well in almost every aspect shown, and the authors also make clear the model's deficiencies and limitations, which is crucial for potential users with applications in mind. As a paper intended to present a new model to the community, I think it serves that purpose well.

Minor comment:

I think it would be of interest to the reader to know what degree of calibration has been done, and how. There are a couple of comments in the text, but I think the 'dark art' of how we tune our numerical models should be made more visible (see e.g. Mauritsen et al., 2012 for a good example). In this case, where it is clear that CLIMBER-X is well suited to methods of performing robust exploration of parameter space (see e.g. Williamson et al., 2013), it would be interesting to know the extent to which this has been done, or remains to be done. I suggest including a section (or possibly a subsection in 2), that describes the

calibration (tuning) that has been done to the model. For example, were components, or schemes within the individual models tuned in isolation, or was the entirety of CLIMBER-X calibrated as one? To what observations or metrics was the model tuned to?

Specific comments/corrections:

Line 77/78: Replace "16 CPUs" with "2 x 8 core CPUs". Also, if your computation is on a single node then the detail "Infiniband FDR14 Lenovo/IBM" is redundant and can be removed.

Line 96: I suggest "We made extensive use of..." instead of "We extensively made use of..."

Line 162: Seem to jump from Appendix 5 (line 153) to Appendix 7. I suggest carefully checking and renumbering/reordering as required.

Line 233: question about rigid lid pressure?

Line 269: Typo: "occupyied" > "occupied"

Line 295: Typo: "distiction" > "distinction"

Line 377: Could compare with Johns et al., (2011). Also worth noting that whilst the overturning transport itself is slightly higher than observation-based estimates suggest, the associated heat transport is lower than observation-based estimates suggest. This discrepancy suggests potential issues with the vertical structure of the transport and the ocean temperature and salinity, evidence of which can be seen in Figs. 12 and 14.

Line 433: Typo: "troposhere" > "troposphere"

Line 449: Suggest citing e.g. Held and Soden (2006) here as a reference for the relationship between the hydrological cycle and Clausius-Clapeyron. Do you see the same

relationship between the amplification of the surface salinity pattern and the increasing hydrological cycle as Zika et al. (2018)?

Line 466: Confusing sentence – reword.

Line 487: Not just EMICs, but also some low resolution AOGCMs (e.g. Hawkins et al. 2011). On this topic, have you calculated the F_{ov} for CLIMBER-X? In contrast to observation-based estimates, many low resolution models show positive values of F_{ov} .

Line 491: Typo: "equilibrim" > "equilibrium"

Line 506: Typo: "models'" > "model's"

Line 673: "anyway" is not necessary - remove

"K" is multiply defined:

- Line 604: "K" is the kinematic vertical viscosity coefficient
- Line 697: the eddy kinetic energy, "K".

Line 767: Typo "atmophere" > "atmosphere", and "computed" > "compute"

Lines 866, 868: "Mcdougall" > "McDougall"

Lines 932, 934, 956: Suggest changing "ocean water" to "seawater"

Line 944: Suggest rewording "Melting of sea ice leads to..." to "Melting of sea ice results in..." to avoid potential confusion with sea ice leads.

Figures 11 and 29: The white text on the contours is difficult to read.

Figures 3, 11, 13, 24, 29: add (a) and (b) for consistency with other figure style
