Referee comment on "How is Baseflow Index (BFI) impacted by water resource management practices?" by John P. Bloomfield et al., Hydrol. Earth Syst. Sci. Discuss., https://doi.org/10.5194/hess-2021-259-RC1, 2021

The paper with title "How is Baseflow Index (BFI) impacted by water resource management practices" is well written and within scope of HESS. This manuscript highlights the controlling factors for baseflow contribution. It specifically look what is the impact of water resources management practice have on baseflow contribution.

Specific comments:

1. The paper does not go in depth about the different water resources management practices and its relationship with baseflow contribution. Baseflow index calculation itself have uncertainty as it was never verified with any filed data. So it would be nice to capture these uncertainty and discuss in the paper.

2. Paper also lack in discussion about practical implication of the finding of the paper.

3. Figure quality is so poor hard to read the values.

4. Line 135, " Figure 3c.... " there is kind of repation of same info.

5. Paper need bit more explanation about Lin's coefficient. please provide the equation.

6. Some where in text it reaured to give details about different model, e.g Model 1, Model 2 in Figure 5

7. I was very surprises Area of the catchment is not that import for the BFI? any comments

8. Line 409, " in addtion ....." why ?

9. Conclusion of this study is bit week, Need to rewrite.
