Comment on hess-2021-81

Anonymous Referee #2

Referee comment on "Spatiotemporal and cross-scale interactions in hydroclimate variability: a case-study in France" by Manuel Fossa et al., Hydrol. Earth Syst. Sci. Discuss., <https://doi.org/10.5194/hess-2021-81-RC2>, 2021

The paper by Fossa et al. describes spatial interactions and cross time-scale features of variability in hydro-climate variables across France. The work is timely and of potential impact, it is relatively well-written and the cross-scale analysis is quite innovative. Therefore, I see potential for publication in HESS, but only after the manuscript will undergo a substantial revision.

In fact, two main points must be addressed with care before the paper can be accepted:

- the methodology cannot be taken for granted for the majority of the readers of this journal. Figure 2 should be a milestone of this manuscript, while instead it is useless in this form, and likely wrong since the caption does not correspond to what is plotted. Instead, figure 2 should clearly show the workflow that leads the reader to acknowledge the results. Also, more explanation on the meaning of the wavelet significance test should be documented.
- the results are not described in depth, and also they lack of a discussion that is necessary to enrich the paper. In particular, a few figures are almost neglected in the description, but in general all results are not discussed in depth, rather there is only a documentation of what can be read in the plots.

Specific comments can be found in the attached documents (I recommend to open the document with Acrobat Reader).
