Comment on nhess-2020-420

Anonymous Referee #2

Referee comment on "Main Ethiopian Rift landslides formed in contrasting geological settings and climatic conditions" by Karel Martínek et al., Nat. Hazards Earth Syst. Sci. Discuss., <https://doi.org/10.5194/nhess-2020-420-RC2>, 2021

Dear authors,

I believe that your work was time-consuming, the quality of Figs. is good according to my opinion, nevertheless the text needs to be rewritten significantly. See my comments in the enclosure, please. The main problem is that you have there several statements which are not relevant, and you lowered significantly the potential scientific value of the paper. Chapters are written with different quality, possibly due to a large number of contributors, but at the end one person should do the redaction and avoid statement which are in contrary. The problem might be also in the scale. I suggest you work in a detailed scale, that you can be sure about the relation "cause - response". Several statements are strange to me.

I hope that you will be able to improve the paper. best regards, reviewer
