Comment on nhess-2021-155

Anonymous Referee #2

Referee comment on "Brief communication: Monitoring a soft-rock coastal cliff using webcams and strain sensors" by Diego Guenzi et al., Nat. Hazards Earth Syst. Sci. Discuss., https://doi.org/10.5194/nhess-2021-155-RC2, 2021

This brief communication presents an interesting monitoring approach, but the scientific presentation could be more sophisticated in general. A clear description of how the monitoring could be applied for predicting purposes specifically would be of interest to the reader. In some parts, a distinction between promoting and triggering processes could be advantageous.

l 14 / 16 / 95 : you only use 1 crackmeter

l 17 / 29 : the precursor signal is a result of the triggered instability, not the other way round

l 24 : subclause needs rearrangement

l 32 / 37 / 61 : position of expression of time

l 36 : how is brittle failure characterized in rock of low mechanical strength?

l 41f : is there literature on this topic?

l 54 : what means “regularly analysed”?

l 56 : how did you use ICC?

l 73 / 84 / 104 : It is to expect that rockfall frequently happens during severe storms and bad weather conditions. How do you deal with that?

l 79 : do you mean “anthropogenic”?

l 83 : how is the opening trend measured by the crackmeter used for predicting an imminent failure?

l 96 : “a couple of years” = 2 years
