Author comment on "Tsunami heights and limits in 1945 along the Makran coast estimated from testimony gathered 7 decades later in Gwadar, Pasni and Ormara" by Hira Ashfaq Lodhi et al., Nat. Hazards Earth Syst. Sci. Discuss.,
<https://doi.org/10.5194/nhess-2021-53-AC2>, 2021

Thank you very much Mokhtari, for the comments. The changes in figures are also suggested by Issa El-Hussain and figures will be revised in the manuscript revision. Locations will also be provided in the revised version.

The eyewitnesses had remembered the landmarks till where the water had reached during the 1945 event while the runup was quantized through a ground survey and Google Earth. The ground survey was conducted to get the lat/long of the landmarks and Google Earth was used to get the runup elevations. We will recheck the values before the submission of revised manuscript.
