Comment on nhess-2021-53

Mohammad Mokhtari

Community comment on "Tsunami heights and limits in 1945 along the Makran coast estimated from testimony gathered 7 decades later in Gwadar, Pasni and Ormara" by Hira Ashfaq Lodhi et al., Nat. Hazards Earth Syst. Sci. Discuss.,
<https://doi.org/10.5194/nhess-2021-53-CC2>, 2021

The paper is well written and contains some important topics especially the on-date newspaper and also a referral to the major interview done in recent years from the people who survived the catastrophe. Clip of Newspapers may be translated into separate boxes to make it more feasible to the future reader. Some figures need to be improved and the location of places mentioned in the text should be shown.

Runup values I feel need to check more carefully and or explain how the people that remember the 1945 tsunami have reached these values?
