We have added the related content to explain the influence of Φz to GTA in Page 8. Added: In this experiment, the value of $\tan\varphi$ map distributes in the range of $[0, 1.472e+03]$. While the vertical gravity data (Φz) contains both positive and negative anomalies within the numerical range of $[-18, 21]$ (mGal/km). We attach the revised manuscript in this reply supplement.
