Both reviewers do not recommend publication of the present manuscript due to its lack of scientific contents. The authors summarized the arguments with a question: "whether papers like ours should only exist as technical reports, or whether they should be peer-reviewed alongside studies of dynamics."

I think the question is valid, but I am not sure if the authors' choice for this particular journal, *Ocean Science*, is a good one. In this sense, I agree with Reviewer 2 that more scientific discussion is needed for OS. The "aims and scope" (https://www.ocean-science.net/about/aims_and_scope.html) states its "primary objective" to "publish a very high-quality *scientific* journal" (emphasis added).

There are other, peer-reviewed, journals dedicated to technical and/or methodological discussion (e.g. `https://www.geoscientific-model-development.net/`).

I looked up recent accepted papers on *Ocean Science* which appear to focus on technical discussion of numerical models. These papers often introduce new methods (Crocker et al., 2020; Sun et al., 2021; Zujev et al., 2021), put emphasis on physics (Wekerle et al., 2020), or global (Heuzé, 2021; Carrere et al., 2021). The present manuscript does not appear to fall into any of these categories. I understand this regional model is applicable to global coastal oceans but the link is not obvious in the present form.

I therefore recommend the authors to find another journal for this manuscript and do not encourage revision for *Ocean Science*.
