Comment on se-2021-100

Federico Rossetti (Editor)

Editor comment on "De-risking the energy transition by quantifying the uncertainties in fault stability" by David Healy and Stephen Paul Hicks, Solid Earth Discuss.,
<https://doi.org/10.5194/se-2021-100-EC1>, 2021

The manuscript received two independent reviews which, despite with a somewhat different assessment, both recognize the potential significance of the study to a broad audience.

Reviewers provided detailed and constructive comments aimed at improving the structure of the manuscript and clarifying some aspects of the scientific rationale.

The authors have provided responses to reviewers' comments and, therefore, I invite the authors to review the manuscript and submit an appropriately revised version.

Best regards,

Federico Rossetti
