Editor comment on "Effects of environmental factors and soil properties on soil organic carbon stock in a natural dry tropical area of Cameroon" by Désiré Tsozué et al., SOIL Discuss., <https://doi.org/10.5194/soil-2021-12-EC1>, 2021

Thank you for starting to respond to the referee. There are a few places where you provide an answer to the referee without stating how the text has been changed to address the comment.

The referee raised the same query I had when the first draft was submitted. Figure 3 is incorrect analysis. You do not do regressions through mean data. In Table 5 you need to work out T-SOCS for each of S1, S2, S3. You then use these values for the regression, so it will be through 12 points.
