Comment on soil-2021-141

Nicolás Riveras-Muñoz et al.

Author comment on "Biocrust-linked changes in soil aggregate stability along a climatic gradient in the Chilean Coastal Range" by Nicolás Riveras-Muñoz et al., SOIL Discuss., <https://doi.org/10.5194/soil-2021-141-AC2>, 2022

Dear reviewer,

we appreciate the time spent and the very enriching feedback to improve the document. We are going to apply the proposed structure and to follow the suggested sequence. In some parts of the discussion, it is not fully applicable because the factors climate, BSC and topography are interrelated. However, the suggested order was incorporated as a reference and large parts of the manuscript will be restructured. We will also shorten long sentences (a Chilean/German speciality:-) for better reading and understanding with the help of a native speaker.

We also thank the reviewer for the very helpful and detailed specific comments. We are going to change the text accordingly and give answers to your questions.

Best regards,

Nicolás Riveras-Muñoz
