Comment on tc-2021-22

Ian Baker (Referee)

Referee comment on "Orientation selective grain sublimation–deposition in snow under temperature gradient metamorphism observed with diffraction contrast tomography" by Rémi Granger et al., The Cryosphere Discuss., <https://doi.org/10.5194/tc-2021-22-RC1>, 2021

Really excellent, ground-breaking paper.

Some minor comments:

1. Why not work on fresh snow rather than snow stored for 7 months. Perhaps, the authors can comment on this.
2. We are told the pore size increases 1%. How real is this? How big are the error bars?
3. "Representativity" should be changed to the real English word of "Representivity".
