express melt rate in mW/m2?

William Colgan

Community comment on "Indication of high basal melting at the EastGRIP drill site on the Northeast Greenland Ice Stream" by Ole Zeising and Angelika Humbert, The Cryosphere Discuss., https://doi.org/10.5194/tc-2021-37-CC1, 2021

Is it possible for you to express your 0.16-0.22 m/yr basal melt rate as an equivalent mW/m2 basal heat flux? This would allow the reader to make a quick comparison with the previous estimate of 970 mW/m2 that is cited.

For another comparison, I believe NGRIP has a reported basal melt of 1 cm/yr and a published range of geothermal heat flow estimates of something like 130 +/- 30 mW/m2. Your observed basal melt rate would be at least 16x greater than this.

I think it is fine to talk about a basal heat flow, as long as "basal heat flow" is not being used interchangeably with "geothermal heat flow".

Interesting read!
