Author comment on "Analysis of the Campinas tornado (Brazil) in June 2016: damage track, radar characteristics and lightning observations of the supercell" by Lucí Hidalgo Nunes et al., Weather Clim. Dynam. Discuss., <https://doi.org/10.5194/wcd-2021-35-AC1>, 2021

Prof. Johannes Dahl

Editor of Weather and Climate Dynamics

Dear professor,

My fellow co-authors and I received with interest the two referee comments (RC1 and RC2) and we think that both brought important contributions. We are grateful for the careful reading done by both, agree with most of the points raised and consider that many of them could be easily incorporated into the manuscript, while some others are recognized by us as important, but could not be fully met due to lack of information that would allow a more comprehensive analysis, which also frustrates our own expectations. As for the last point, not much could be done, given that some requested information simply does not exist, but the lack of some information could be explained.

However, the arguments raised by you, as the editor, seem to indicate that there would be no interest and/or confidence in our ability to present a revised version that meets the journal's expectations.

Having said that, we are immensely grateful for the opportunity and the relevant suggestions offered, but we decided to withdraw the submission.

Sincerely,

Prof. Lucí Hidalgo Nunes
