Community comment on "Impact of the wind field at the complex terrain site Perdigão on the surface pressure fluctuations of a wind turbine" by Florian Wenz et al., Wind Energ. Sci. Discuss., https://doi.org/10.5194/wes-2021-101-CC1, 2021

Dear Referee #1, dear Editor, dear Community,

On behalf of the industrial project partner ENERCON, I am happy to declare that the manuscript of the authors has undergone our usual internal review before submission. The review was conducted by several colleagues from different departments within ENERCON R&D and with professional background in different science and engineering disciplines, including myself.

The manuscript was highly evaluated. Without being convinced of its high quality and relevance, we as industrial partner would not have approved its submission.

For us, it is difficult to understand the views expressed in comment RC1 without receiving more specific comments and explanations. Furthermore, we would appreciate any criticism to be articulated in a constructive manner, ideally accompanied by suggestions how to improve.

We therefore wish to invite for and encourage a clarification of comment RC1. Thank you very much in advance for your understanding.

Kind regards,
Marcus Letzel
